

CONFIDENTIAL PRIZE SAVINGS • BUILT ON ZAMA'S FHEVM

VaultShot

Confidential no-loss prize savings, built on Zama's Protocol.

Deposit, earn a shot at the prize, withdraw anytime — and no one but you can see your balance.

What VaultShot Does

Fully Confidential Balances

Every deposit, balance, and withdrawal is encrypted end-to-end using FHE — nobody, not even the protocol, can see individual amounts.

Provably Fair, Encrypted Draws

Winners are selected using native on-chain FHE randomness weighted by encrypted balances — verifiable fairness without ever revealing who has what.

Withdraw Anytime, No Loss

Principal plus any winnings can be withdrawn in a single transaction at any time — deposits are never locked or put at risk.

THE PROBLEM

No-loss savings today has no financial privacy

PUBLIC LEDGER, TODAY

0x7a ... 4f1	42,000 USDC
0x2c ... 9b8	1,250 USDC
0x9e ... 0d2	318,900 USDC — WINNER

Traditional no-loss prize savings protocols — like PoolTogether-style designs — expose every user's deposit size and every draw outcome on a public ledger. There's no financial privacy, and losers can infer who won just by watching balances change.

THE VAULTSHOT VIEW

Same protocol, nothing to see

PUBLIC LEDGER, ON VAULTSHOT

0x7a ... 4f1

●●●●● cUSD

0x2c ... 9b8

●●●●● cUSD

0x9e ... 0d2

WINNER — amount sealed

On VaultShot, the chain records that deposits, draws, and withdrawals happened — never how much. Only the account holder can decrypt their own balance; everyone else, including the protocol, sees ciphertext.

MECHANICS

How It Works

ROADMAP

Version Roadmap

V1 — FoggyPot

SHIPPED

Plaintext ERC-20 deposited directly into the vault, encrypted internally. Draws use on-chain FHE randomness over encrypted balances. Withdrawals: two-step request → decrypt → finalize. Deployed and tested live on Sepolia.

V2 — VaultShot

CURRENT

Assets wrapped into a standalone confidential ERC-7984 token (cUSD) before touching the vault — genuine encrypted transfers end to end. Two-phase draw reveal exposes only the aggregate pool total. Withdrawals: single transaction. Live on Sepolia with a full SDK-based client.

V3 — Mainnet

FUTURE

Security audit; real yield via confidential integration with Steakhouse Financial's cUSDC vault, routed to the prize pool through a Liquidation Pair auction. Decentralized keeper network, multi-stablecoin & multi-horizon pools, full wallet UX. Target: Ethereum L2s.

SYSTEM DESIGN

Architecture Overview

USER FLOW

YIELD & PRIZE FLOW

Draw Keeper triggers each round; the Vault settles winner payouts back to depositors.

Confidentiality Guarantees

What Stays Encrypted

- Individual deposit amounts
- Per-user balances
- Individual withdrawal amounts
- Who holds how much at any time

What's Necessarily Public

- That a deposit/withdrawal occurred
- Aggregate pool total at draw time
- The winning address
- Contract logic and draw timing

UNDER THE HOOD

Technical Stack

Zama fhEVM

OpenZeppelin Confidential
Contracts (ERC-7984)

Foundry

Zama Relay SDK

Ethereum Sepolia

CLOSING

**From FoggyPot to VaultShot to mainnet — building
the first truly private no-loss savings protocol.**
